

 Make your cool choice

Evaporative Towers

Our Company

TECHNOLOGY, SUSTAINABILITY AND PERFORMANCE

FOR YOUR SYSTEM

W-tech cooling towers are the only ones made entirely of Magnelis®, an environmentally sustainable alloy made up of 93.5% zinc, 3.5% aluminium and 3% magnesium. The percentage of magnesium allows the self-repair process after cutting operations and protects deformed surfaces. Moreover, the corrosion resistance is very high even in chlorine and ammonia rich environments.

Choose the right tower for you

- TAA open-circuit towers with axial fans are the best-known machines and can be used for industries of all types and for all qualities of water. The fans are arranged on top of the machine and are characterized by their low power consumption and small installation space.

- TAP axial open type forced cooling towers, have higher efficiency and simplified maintenance due to the positioning of the motor and fan in the basin section.

- TC evaporative towers with centrifugal fans, are characterized by high efficiency and low operating costs. Low noise together with sufficient static pressure makes it possible to install the cooling tower in enclosed spaces.

- TCR low height evaporative towers with centrifugal fans are perfect for building installations and low height spaces.

Features and benefits

TECHNICAL FEATURES

The standard unit is constructed of **Magnelis®** ZM310 panels for maximum surface protection. All machine connections are galvanized steel (AISI 304L upon request).

The **air intake grilles** are PVC with a dual flow-change geometry so as to limit both the passage of sunlight into the basin and the passage of any debris or accidental spillage of water.

The **basin section** is constructed with a thick structure and is equipped with a removable AISI 304L anti-cavitation type filter and water make-up valve, with brass/stainless steel body and stainless steel or polypropylene floating ball.

The basin surface is sloped to allow complete drainage and emptying in case of maintenance, preventing water stagnation and bacteriological development.

The **fill**, or exchange, pack is made of PVC (PP on request), and the proprietary geometry used is such as to maximize the heat exchange surfaces between air and water.

Water is uniformly distributed by a **pipng system** inside the machine, made of PVC with a **Magnelis®** sheet metal distribution box. The spray nozzles are non-clogging type, medium and large diameter, made of ABS and easily replaced in case of maintenance.

The **drop separators** are made of PVC (PP on request) divided into several pieces to facilitate their removal in case of replacement or inspection. The separators used to allow passage of 0.001% of the droplets present at the inlet eliminating further water loss and possible accumulation of aerosols containing Legionella.

All components are supplied assembled. Each unit, prior to delivery, undergoes **hydrostatic testing** to ensure that there are no water leaks in the tank, and electrical testing to verify that the electric motors have absorption in line with the nameplate data.

Main benefits

REDUCED ENERGY CONSUMPTION, FROM 20% UP TO 80%, COMPARED TO AIR COOLING

MORE THAN 95% WATER RECIRCULATED

LOWER INITIAL INVESTMENT, COMPARED TO OTHER COOLING SYSTEMS

LOWER ENVIRONMENTAL IMPACT, DUE TO LOWER ENERGY CONSUMPTION

LESS SPACE REQUIRED, COMPARED TO AIR-COOLED MACHINES

WATER TREATMENT

To effectively prevent fouling or bacterial contamination, **W-tech** has developed **W-CARE**: a broad-spectrum treatment system that acts both as an antiscaling, anti-algae and antibacterial biocide.

Proper water treatment extends the life of the system and the tower itself while minimising consumption.

INNOVATIVE MATERIALS

We invest in the future through a research and development plan. This allows us to optimize processes and introduce the most innovative materials on the market in the construction of our products

CUSTOMIZATION

Each of our solutions can be customized based on the customer's needs, to offer the state of the art of heat dissipation.

WHY CHOOSE W-TECH?

CERTIFICATIONS

With a view to continuous quality improvement, our company is part of some of the most important world bodies and certification institutes.

CUSTOMER SUPPORT

We provide our experience to provide pre/post sales advice. We are able to provide solutions very quickly.
