

# HYDRO-PNEUMATIC PLOUGHS

## DIR T-REX-L

T-Rex is a new hydro-pneumatic plough used to work both inside and outside the furrow, It breaks and turns over dry, humid, mixed or mainly stony soils. The reinforced frame is made up of high mechanical resistance tubes and steels in order to prevent the main beams from bending. The wide space between the tines and the moldboard avoids the clogging because of some cultivation residues. The hydraulic operating system avoids any breakage and offers considerable advantages by reducing traction stress, working time, maintenance costs and fuel consumption.
