## Book your free consultation

Now, if you like what you read or you have any extra questions, you can book a free online meeting to discuss your project with our consultants. Tell us about your project and we will get the correct consultant for you.

[CONTACT US](#)

With Sanger sequencing technology, we can cover up to 1200 bp of your samples, starting either from purified or unpurified PCR products, or plasmids. If needed, we can also perform gDNA extraction to fit your project.

If you want to be sure your hard work of obtaining your precious samples is rewarded with excellent sequencing results, this is the service for you.

At our facilities, our experienced technical team will premix either single tubes or full plates and sequence your samples on the 3730xl DNA Analyzer. After getting your results, our quality control team will check them to make sure you only receive the highest quality sequencing results.

### HIGHLIGHTS

This is a non-barcoded sequencing service which is useful for one-off projects or if the bulk of your sequencing needs to be done at once. This sequencing comes in the form of individual tubes and 96-well plates. [Contact us](#) for more information.
