

## Openbridge NEXT ERP edition: evolve your business model

*Optimize working capital with an integrated, real-time financial view, and create a holistic perspective on business operations*

Often, financial data relies on operational information that does not flow smoothly between departments, resulting in inefficiencies and complexities. The Openbridge NEXT ERP edition is designed to integrate all operational data, enhancing resource management with up-to-date insights on the actual state of operations. This innovation not only streamlines internal processes but also provides a significant competitive advantage, enabling CFOs to make decisions based on concrete, timely data. Companies can leverage airpim's software technology to manage the data flow that contributes to determining and optimizing working capital. With an integrated view of finances and operations, organizations can quickly identify areas for improvement and implement effective strategies to maximize liquidity.

### **Connects the Entire supply chain, end-to-end**

Openbridge NEXT ERP edition allows for the connection of all relevant internal and external data, activating software modules to facilitate the operations of various business functions. This capability enables tracking of the entire data supply chain generated by different departments, including clients and suppliers, simplifying overall management for a real-time holistic view of operations. This enhances transparency and fosters collaboration among departments, creating a more synergistic and productive work environment.

### **Integrates with existing data**

The system connects seamlessly with existing data through integrations with various software systems already in use, such as ERP, CRM, MES, and machinery/PLC, along with client and supplier data. Users can access all necessary, clean, and real-time updated data via the platform's dashboard. This interoperability ensures a continuous flow of information, reducing the risk of errors and improving operational efficiency.

### **Adds software modules to track missing operational data**

Specific modules can be configured to integrate and enrich existing data based on needs. The system collects additional data even from complex environments. Available modules include

Marketing and Sales for accurate forecasting; Production for tracking process progress; Logistics for optimizing goods movement; and Remote Monitoring for tracking actual cycle times. The flexibility of this technology allows companies to quickly adapt to market changes and proactively respond to customer needs.

### **Creates a digital model of the company**

Once the data is connected, the Openbridge NEXT ERP edition enables the creation of digital models that map the dynamics of business processes. Specific algorithms give contextual meaning to the data in relation to the company's business model, enhancing the understanding of internal processes and providing the opportunity to simulate future scenarios and evaluate the impact of decisions.

### **Transforms data into business logic**

With the integrated model, it is possible to correlate data from various sources and apply proactive logic across different operational processes. airpim's technology brings data to life, providing projections of financial flows directly linked to operations performed throughout the supply chain. This empowers CFOs to continuously monitor business performance and make timely adjustments to improve results.

### **Adapts to the business model**

The modular architecture perfectly adapts to each company's business model, allowing for the timely distribution of necessary information in the right format to the appropriate recipients. This feature improves the quality of the distributed data and reduces operational errors, ensuring that every decision is supported by accurate and relevant information.

### **Liberates capital resources**

Openbridge NEXT ERP edition integrates all data into a single dashboard, processes it with algorithms tailored to the company's business model, and optimizes financial flow planning with real-time updated information. This approach not only liberates capital resources but also enables a more strategic management of corporate finances, ensuring that every investment is targeted and productive.
